**Abstract**—In this project we were given a time series prediction problem in which 275 data points have been given which are measurements of the physical variable  $y(n)$  where  $n$  denotes year, the given data can be seen in fig. 1 below. The task is to predict the following 30 data points for  $y(276), \dots, y(305)$ . Using Neural Net tool box of MATLAB, we have solved the time series prediction problem by training  $n$ -layered neural-net with the (lm) algorithm and using early stopping.
